

ANIMESH JHA

Senior Full Stack Developer + AI Engineer

Bangalore, India | +91 8109876429 | animeshjha.dev@gmail.com | [LinkedIn](#) | [Portfolio](#) | [GitHub](#)

PROFESSIONAL PROFILE

Product-minded Senior Full Stack Engineer with 5 years of experience building business-critical SaaS, fintech, HR tech, enterprise workflow, mobile, and AI-enabled products. I work best where engineering connects directly with product outcomes: turning unclear workflows into usable systems, stabilizing high-pressure applications, improving performance, and taking responsibility from architecture to release.

My career started in an enterprise project role, but software product development had always been the direction I wanted to grow into. Since moving into engineering, I have worked across React, Next.js, TypeScript, Node.js, React Native, MongoDB, MySQL, PostgreSQL, SAP BTP, SuccessFactors integrations, REST APIs, SSO, RBAC, AWS S3, Vercel, CI/CD, and AI-assisted development workflows.

CAREER CONTEXT & LONG-TERM DIRECTION

My transitions were driven by role fit, product direction, company restructuring, and relocation constraints. Wipro was a non-development enterprise operations role, so I moved intentionally into software engineering. At Trustt, the fintech lending product our team built was later discontinued after launch due to executive product decisions. Next Quarter went through financial restructuring and layoffs. My most recent transition from Veritas Prime was driven by a required move from Bangalore to Hyderabad on very short notice, which was not practical.

I am now looking for a stable, long-term senior engineering role, own meaningful systems, work with modern AI-first product engineering, and grow with the same team.

CORE ENGINEERING STRENGTHS

- **Product ownership:** Able to understand business workflows, clarify scope, design implementation paths, and take features from idea to production.
- **System stabilization:** Strong experience recovering unstable systems through frontend optimization, backend refactoring, database tuning, deployment improvements, and stress testing.
- **Full-stack execution:** Comfortable working across UI, APIs, databases, authentication, integrations, deployment, and release quality.
- **Enterprise product thinking:** Worked on HR/payroll-impacting workflows, fintech lending portals, dashboards, mobile time tracking, approval systems, and operational tools.
- **Leadership:** Managed and mentored a team of 3 engineers, reviewed code, resolved blockers, coordinated releases, and collaborated with product, QA, design, and stakeholders.
- **AI-first direction:** Built independent AI-enabled products and use modern AI-assisted engineering workflows responsibly with manual validation and production ownership.

TECHNICAL STACK

- **Frontend:** React.js, Next.js, TypeScript, React Native, Material UI, Highcharts, Balkan Org Chart, responsive dashboards, reusable component systems.
- **Backend:** Node.js, REST APIs, authentication, SSO, RBAC, middleware, workflow APIs, audit logs, PDF exports, API design.
- **Databases:** MongoDB, MySQL, PostgreSQL, query optimization, indexing, pagination, high-volume data handling.
- **Cloud / Platform / DevOps:** SAP BTP, AWS S3, Vercel, Hostinger DNS, GitHub CI/CD concepts, production deployment, multi-instance scaling, load balancing.
- **AI / Modern Development:** Codex-assisted development, AI workflows, prompt-based product flows, API integration, debugging, refactoring, deployment validation.
- **Tools & Process:** GitHub, Jira, code reviews, sprint execution, release coordination, stakeholder communication, production troubleshooting.

PROFESSIONAL EXPERIENCE

Veritas Prime Labs, Hyderabad

Senior Full Stack Developer | Oct 2023 - March 2026

Worked on enterprise HR tech and SaaS products connected with SAP SuccessFactors and SAP BTP. Responsibilities moved beyond feature development into architecture, team mentoring, stakeholder communication, production stability, release ownership, and performance recovery for business-critical products.

- Led full-stack development using React, React Native, Node.js, TypeScript, MongoDB, MySQL, SAP BTP, SuccessFactors APIs, SSO, and REST APIs.
- Managed and mentored 3 engineers, reviewed merge requests, resolved technical blockers, coordinated releases, and helped convert product requirements into practical engineering plans.
- Designed and developed architecture for the Overtime Management Platform, including multi-tenant structure, SAP SuccessFactors SSO, dynamic tenant database connections, approval workflows, RBAC, audit flows, pagination, and MongoDB indexing.
- Led major parts of the Prime Time Tracking mobile application, including offline/online time tracking, SuccessFactors authentication, mandatory photo capture, AWS S3 image handling, PDF exports, audits, and Android/iOS release support.
- Took ownership of the Mass Changes Platform when it was unstable and under client escalation, then optimized frontend, backend, database, and SAP BTP deployment behavior to bring it back to usable production condition.
- Improved Mass Changes from frontend crashes and 10+ minute API timeouts to a system that loaded within seconds, returned API data in 2-3 seconds, and supported 1,000+ concurrent users compared with earlier crashes at 10-20 users.
- Introduced stress testing and performance reporting as a production-readiness practice to identify bottlenecks before peak usage windows.

Next Quarter (formerly Forecast Era), Hyderabad

React Developer | Nov 2022 - July 2023

Worked on enterprise dashboard interfaces and data-heavy frontend workflows. This role strengthened my React component architecture, dashboard UX, visualizations, API integration, and release collaboration with QA and product teams.

- Created reusable React.js components using Material UI for enterprise dashboards and internal business workflows.
- Built interactive tables, charts, and reporting views using Highcharts, improving how users consumed business and performance data.
- Implemented organization hierarchy visualization using Balkan Org Chart, making complex reporting structures easier to understand in the UI.
- Integrated frontend modules with backend APIs, handled UI fixes during QA cycles, and supported production release readiness using GitHub and Jira.
- Improved UI maintainability by moving repeated interface patterns into structured, reusable components.

Trustt (formerly Novopay), Bangalore

Full Stack Web Developer | Aug 2021 - Oct 2022

Moved fully into product engineering through a fintech/lending product role. Worked on customer, retailer, and internal support workflows that supported loan tracking, lead management, application data visibility, and operational dashboards.

- Developed fintech/lending platform features using Next.js, React.js, Redux, Strapi, Appwrite, and REST APIs.
- Built customer and retailer portals to support loan tracking, lead management, and application-status visibility.
- Designed internal dashboards and support tools to help teams manage loan application data, customer operations, and dynamic content workflows.
- Worked through the product build and launch phase, gaining practical experience in fintech workflows, real user-facing features, and product delivery discipline.

Wipro Ltd, Pune

Project Engineer | March 2021 - Aug 2021

Started in a global enterprise environment supporting cybersecurity and access management operations. The role gave me exposure to client operations and enterprise process discipline, but it was not a software development role, which led me to move intentionally into product engineering.

SELECTED PRODUCT & PROJECT DEEP DIVES

Mass Changes Platform | Veritas Prime

React | Node.js | MySQL/PostgreSQL | SAP BTP | Enterprise HR Data

Product context: A business-critical HR data management platform connected with SuccessFactors/SAP workflows. The application handled data for around 100,000 employees and was used by 30,000+ managers/HR users, with the heaviest usage in the first 10 days of each month when managers and HR teams made employee-data changes that could directly affect payroll.

Problem: The product had reached client escalation because the frontend was crashing, APIs were timing out after 10+ minutes, and even 10-20 concurrent users could make the system unstable. The application needed urgent optimization across UI, backend, SQL, and deployment behavior.

Ownership & work done: Became the primary developer responsible for stabilizing the product. Optimized frontend rendering behavior, refactored backend APIs, rewrote complex SQL queries, added indexing, improved data handling, tuned SAP BTP deployment behavior, configured multi-instance usage/load balancing, and introduced stress testing to generate performance reports and identify bottlenecks.

Impact: Recovered the application from frequent frontend crashes to loading within a few seconds, reduced backend responses from 10+ minute timeouts to 2-3 seconds, and improved concurrency from failing at 10-20 users to supporting 1,000+ users working together. This became the strongest example of my ability to take ownership under pressure and convert a failing product into a usable production system.

Overtime Management Platform | Veritas Prime

React | Node.js | MongoDB | SAP BTP | SuccessFactors | Workflow Engine

Product context: A multi-tenant enterprise overtime management SaaS platform for organizations that needed configurable overtime requests, review flows, approvals, admin configuration, and SuccessFactors-linked authentication.

Ownership & work done: Designed the product architecture and worked end-to-end across frontend modules, backend APIs, workflow management, data synchronization, tenant-specific database handling, SAP SuccessFactors SSO, RBAC, pagination, MongoDB indexing, and performance-focused API design.

Impact: The product was already being used by the client before I left. This project is important because it shows my product-builder side: I was not only implementing tasks, but designing the foundation of the application, supporting developers, making architecture decisions, and thinking through how the system would scale for different tenants and approval rules.

Prime Time Tracking Mobile Application | Veritas Prime

React Native | Node.js | MongoDB | SAP BTP | SuccessFactors API | AWS S3

Product context: An enterprise mobile time-tracking application where employees could log time with online/offline capability. The workflow required SuccessFactors authentication and mandatory photo capture for time logging, making reliability and mobile release quality important.

Ownership & work done: Led and contributed across React Native mobile flows, backend APIs for logs/history/RBAC/PDF exports/audits, offline-online synchronization, secure photo capture with feature flags, AWS S3 image storage with restricted access, and Android/iOS release support.

Impact: Helped turn a complex enterprise time-tracking requirement into a production-ready mobile workflow. The project shows my ability to work beyond web dashboards and handle mobile, backend, storage, authentication, release, and enterprise-user behavior together.

INDEPENDENT AI PRODUCT WORK

P3Kit - AI-Powered Interview Preparation Platform

Next.js | TypeScript | AI Workflows | Codex | Vercel | Hostinger | CI/CD

Link: <https://p3kit.arkionlabs.in>

Product context: An AI-enabled interview preparation platform that generates personalized interview preparation kits based on a candidate resume and role/job-description inputs. The product is designed to move beyond generic interview question banks and create more contextual preparation material.

Work done: Built dashboard workflows for user inputs, AI generation flows, result review, structured preparation output, API usage, deployment, GitHub-based CI/CD, Vercel hosting, Hostinger domain/DNS configuration, production routing, debugging, refactoring, and UI iteration.

What it proves: Shows my current direction toward AI-first product engineering: not only using AI tools, but building actual AI-assisted user workflows with product thinking, deployment ownership, and maintainability in mind.

Ledeqor - AI Learning & Career Upgrade Platform

Next.js | TypeScript | AI Workflows | Codex | Vercel | Hostinger | CI/CD

Link: <https://ledeqor.arkionlabs.in>

Product context: A project-driven learning and career-upgrade platform focused on AI Engineer learning paths, capstone tracking, AI tutor workflows, and career asset building.

Work done: Owned product planning, frontend architecture, dashboard design, deployment setup, AI-assisted development workflows, hosting, domain setup, CI/CD workflows, feature validation, and future expansion planning for paid access, AI tutor flows, capstone systems, and structured learning modules.

What it proves: Shows that I can think like a product builder and independently convert a learning/product idea into a working deployed platform while using AI tools responsibly and validating production behavior manually.

EDUCATION

Full Stack Coding Bootcamp

01/2021 - 07/2021 | Newton School

Bachelor of Computer Science

06/2016 - 07/2020 | Technocrats Institute of Technology, Bhopal, M.P.
